## Press release

### **Azimut and Majescor outline 17 uranium target areas at West Minto, Nunavik, Quebec**

Longueuil, Quebec – **Azimut Exploration Inc.** (“Azimut”) and **Majescor Resources Inc.** (“Majescor”) announce the results of a helicopter-borne survey performed at the West Minto uranium property in Nunavik, northern Quebec. Seventy-one (71) priority uranium targets have been defined from helicopter-borne geophysics, forming 17 kilometric-scale distinct target areas. The West Minto property comprises 952 claims covering a surface area of 432 km<sup>2</sup>. Majescor has an option from Azimut to earn an interest of up to 65% on the property.

Geo Data Solutions Inc. (“GDS”) of Laval completed a magnetic and radiometric survey of the property in mid-August, covering 4,610 line-km at 100 m line spacing. Geophysical consultant MB Geosolutions of Quebec-City, in conjunction with technical staff from Azimut and Majescor, have defined and categorized 71 high priority uranium targets at West Minto’s Block AB, forming 17 distinct zones, after examining the preliminary data. Over 400 uranium anomalies were categorized on the West Minto property – 328 anomalies on Block AB and 79 anomalies on Block CD. An additional 34 map-designated claims were subsequently staked to protect a few of the targets.

The West Minto property is underlain by Archean tonalitic and granitic rocks straddling a narrow north-trending felsic volcanic interval composed of rhyolites, dacites and pyroclastics. Most of the anomalous uranium zones appear located along the flanks of the felsic volcanic unit. When the final helicopter-borne geophysical data is evaluated by Majescor and Azimut, the partners will develop a comprehensive follow-up exploration program for the property.

This press release was prepared by Zoran Madon, P.Geo., Majescor’s Exploration Manager, acting as Majescor’s Qualified Person under National Instrument 43-101 and revised by Jean-Marc Lulin, Azimut’s Qualified Person.

Azimut is a mineral exploration company using cutting-edge targeting methodologies to discover major ore deposits.
