Press Release

Azimut and NWT Uranium have started drilling at North Rae, Ungava Bay region, Quebec

Longueuil, QC – **Azimut Exploration Inc.** (“Azimut”) and **NWT Uranium Corp.** (“NWT Uranium”) announce that drilling is underway at the North Rae uranium property in the Ungava Bay region of northern Quebec, Canada. The drill program started in late August and focuses on high priority areas, which consist of outcropping radioactive targets. Five holes totalling 362 m have been completed to date. The goal, at this stage, is 20 holes in five areas for a total of 1,200 metres. Drilling will continue as long as weather conditions permit.

Thus far, seven radioactive zones have been identified for follow-up work and grids have been completed on four of those zones (see press release dated August 8, 2007). The zones display elevated radiometric values ranging from 1,000 to more than 100,000 counts per second (cps), in sharp contrast to background values of approximately 120 cps. Interpretation of field results is underway and a significant amount of rock sampling results is pending.

NWT Uranium has planned a budget of \$1.5 million for the 2007 program on the North Rae and adjacent Daniel Lake properties. The properties are under option from Azimut. At North Rae, planned field expenditures are \$1.2 million. NWT Uranium is the operator for both properties, which collectively include 2,707 claims and cover 1,222 km². IOS Services Géoscientifiques Inc. based in Chicoutimi, Quebec, is responsible for the current exploration program. Drilling is being conducted by Forage à Diamant Benoît Ltée of Val d’Or, Quebec.

Azimut and NWT Uranium believe that the results acquired to date for the North Rae property are very encouraging and may lead to the discovery of a new uranium district.

This press release was prepared by geologist Jean-Marc Lulin, the company’s Qualified Person as defined by NI 43-101. Azimut is a mineral exploration company using cutting-edge targeting methodologies to discover major ore deposits.
