Press Release

Azimut and Everton plan a winter drill program at Opinaca

Longueuil, QC. **Azimut Exploration Inc.** (“Azimut”) and **Everton Resources Inc.** (“Everton”) announce their plan for a winter 2008 drill program based on the results of exploration work conducted earlier this year on the Opinaca A and B properties in the James Bay region of Quebec.

2008 winter program

Recognizing the favourable geological setting and the quality of the mineralized targets in the vicinity of the Eleonore gold deposit for which **Goldcorp** recently announced an initial gold resource of 2.8 million ounces and a near-term target of 5 million ounces, Everton will conduct the following winter program:

Geophysics starting in January, which will consist of 100 line-km of induced polarization (IP) and magnetic ground surveys:

- Opinaca A - over the southern portion of the property (4 km north of the Eleonore gold deposit); and
- Opinaca B - along the **Claude-Manuel** corridor between Azimut’s Claude Target (optioned by Everton) and the Manuel Showing (12.0 g/t Au over 4.6 m), which is on Everton’s Wildcat 5 property.

Drilling starting in March, based on the results of the geophysical surveys:

- Opinaca A - **Charles Target** and western extension of the **Smiley Target**; and
- Opinaca B - **Dominic Target**, a newly discovered target along the Claude-Manuel corridor.

Results of the 2007 programs

The 2007 summer and fall programs consisted of:

- 40 line-km of IP and magnetic ground surveys;
- 500 km of traverses;
- the collection of nearly 2,000 rock samples;
- trenching; and
- 1,650 m of drilling.

Opinaca A – Charles Target and Smiley Target

Eight drill holes (totalling 969 m) were completed to test the extensions of the Charles Target where surface sampling over an area of 1,300 m by 100 m identified values up to 35.9 g/t Au, including 9 values over 10.0 g/t Au and 35 values over 1.0 g/t Au (press release of September 13, 2007). All drill holes intersected altered metasediments containing variable amounts of sulphide

mineralization. The most recent interpretation of the Charles Target suggests a possible extension further south. The table below summarizes the best drill intersections:

Hole #	From (m)	To (m)	Length (m)	Au g/t
AC-07-01	141.0	150.0	9.0	0.8
including	141.0	143.0	2.0	2.7
AC-07-02	140.2	144.1	3.9	0.9
	169.6	177.0	7.4	0.5
	212.2	218.5	6.3	0.8

Three other holes were drilled at the Smiley Target. Sulphide mineralization was intersected in each drill hole but no significant values were obtained.

Opinaca B – Dominic Target and Claude Target

Gold values obtained at the Dominic Target returned 6.1 g/t Au, 4.5 g/t Au and 1.7 g/t Au associated with pyrite in silicified and chloritized metasedimentary rocks with quartz and pegmatite veins (press release dated August 9, 2007). Another sample located 3 km southwest along the corridor returned a value of 1.2 g/t Au.

Rock sampling and trenching in the Claude Target area (for which drill hole OP-06-07 previously returned 1.0 g/t Au over 21.5 m) yielded grab samples with gold grades of 5.8 g/t Au and 4.3 g/t Au, and a channel sample grading 2.4 g/t Au over 0.5 m. These results were obtained from a new mineralized zone that trends parallel to the northern edge of the main Claude Target.

Everton has the option to earn from Azimut a 50% interest on the Opinaca A and B properties, and may earn an additional 15% interest upon the delivery of a bankable feasibility study. Everton is the project operator.

Fieldwork was performed under the supervision of Marc L'Heureux, P. Geo. and VP Exploration of Everton, who acts as Everton's Qualified Person as defined by NI 43-101. Samples were assayed by Laboratoire Expert Inc. of Rouyn-Noranda, Quebec. This press release was prepared under the supervision of Marc L'Heureux and reviewed by geologist Jean-Marc Lulin, Azimut's Qualified Person.

Azimut is a mineral exploration company using cutting-edge targeting methodologies to discover major ore deposits.
